

Topics	Problems and questions	Possible solutions	Priority
<b>General remarks</b>	easy to use in general, however a first time user might have a hard time figuring out what he has to do in the start-up screen.	Display in the beginning a hint like "click on the a country on the globe to get started"	3
<b>Start-up screen/Globe</b>	clicking on any country (e.g., South Africa) brings you to Asia...	Start with Asia in front of the globe	2
	Time slider is not used in any way	is not necessary on the intro screen because no result is shown -> remove	1
	Which country to choose?	Show in tooltip or info panel (mouse over function)	2
	Globe rotation is faster than mouse panning	Adjust rotation speed	2
	A new tab is opened when clicking on a country	Stay in the same window (replace globe div with map div)	3
<b>Menus</b>	flight search not working (quicktrip widget x.focus() error) (in Safari)	fix if possible. (it works with Firefox and Chrome). However it requires a popup window and many people block those. so you might want to check if there is an easy fix (either in the settings of the widgets- otherwise just let it go)	3
	Chrome v42 - when clicking zoom in/out the main menu disappears	not sure about solution: are there other event listeners attached to zooming functionality? Don't bother about it	2
	Cannot click on the label to turn on/off the layers	add a label tag to the checkboxes	1
	on the layer menu, cannot click on the arrow to open and the cursor is a caret one when we hover on the name	show that a user can click on a menu title => cursor:pointer and make arrow clickable	2

	when you click on NATURE, SPORTS, CULTURE, a blue frame appears around it	Should not be outside the menu	3
	when you click on Wonder/Animals/Winter sports/ Summer sports the arrow doesn't match the arrow of the NATURE/SPORTS/CULTURE -> arrow down that means it is open	be consistent and try to make it that when a submenu is open, it behaves the same as the top level	3
	legend for icons missing	add icons next to the text	3
	Layer titles: surf; wonders	Better: Surfing, Natural wonders or Natural landmarks	3
<b>Imprint</b>	not yet finished	finish it and make it easier to read (larger? list? ...)	1
	Team members	List all team members	1
	Data sources	missing – in your case, for the wikipedia page nut a general soucre indication will be enough. but for other sources, please be morew accurate	1
<b>Map Description</b>	this isn't really a description of the map, rather of the Atlas	M.D. should provide infos about the map theme (e.g. about animals in general, or the "big six")	1
	the content of the MD could go in an "about" button	do	2
<b>Basemap</b>	good	This is not a problem, just a good point that a tutor wanted to mention	: -)
	zoom out / panning is too permissive	restrict how much zoom out / panning is possible	1
	a detailed view with locations of event is mentioned in the concept, but there is only a basemap	add a more detailed base map for the large scale zoom level (probably too late)	3

<b>Thematic overlay</b>	same polygon fill color for different animals	Increase transparency, eventually add a border (thin), add a onclick event that allows to query with animal it is.  //NO //different fill colors for animals/polygons (or an alternative - I understand you want them green so that it match the Nature menu NP)	2
	green icon have a bad contrast with the background	consider changing the green to a green a bit darker (would also match the other two colors that are a bit less "fluo")	2
	Popup: spelling mistake typ (surf and wonder categories)	in English: Type	1
<b>Interactivity</b>	icon info is placed directly over the icon	place it nearby	2
	Flight search: nicely designed but user entries skipped (in safari)	Avoid entries without any effect	2
	Time slider: the user cannot know that it can make it disappear by clicking on the "select your favorite month" button	Should say "hide" when slider disappears on click	2
	there is a highlight function on the countries... but with no information coming. where is the info box with country name and other information...	the highlight is useless if not link to something like an info window with information about the country. make one like it was in the earlier prototype of the atlas	2
	Print screen does not include the map/globe (on Chrome), on Firefox, what gets printed is not 100% optimal	fix if possible, possibly remove it	3
	Share URL to the atlas works well	This is not a problem, just a good point that a tutor wanted to mention	: -)
<b>GUI</b>	information window not functional	make functional	1
	info window - open and close 2 times - body is moved to the left	set position of the info window relative to the body from the beginning	1

	info window x button slightly moved to the right/not centered	correct	2
	Same title for globe and map	Use more specific titles	2
	because your base map is gray, your gray menu "disappear" visually within the map. It is hard to differentiate at one glance what is the map and what is the GUI. Additionally, the plane icon is black and the rest white/gray	I would suggest to think again about the color scheme for your GUI and to be absolutely consistent about it	2
	also transparent thematic menu (especially pink color) disappears on gray background map	make thematic menu less transparent	2
	Time slider is an important part of your atlas: but it disappear within the map (see comment about the gray menu).	when you think about the GUI/menu, consider also to make the month name bigger or more proeminent, maybe put the slider in a box with the "select your favortie month". then you can have a "cross" button to show that you can close the box (like the info box)	2
	additional consideration about the GUI. you should see if it is not better to have the info and plane button wihtin the top bar with the other button.		3
	buttons in the top bar menu not all the same size, wierd	make consistent	2
<b>Multimedia</b>	except some information about the places and a few videos, rather minimal	in the concept you mentioned the idea of adding image of the location (probably too late to correct)	3
<b>Code</b>	General reminder	Clean your code, comment it clearly and set the right indentation: some of your files (html and js) are better commented than other. It might be worth to go through them and do some cleaning up and add some comment to your code so that it is easier to follow	1
